1. Introduction

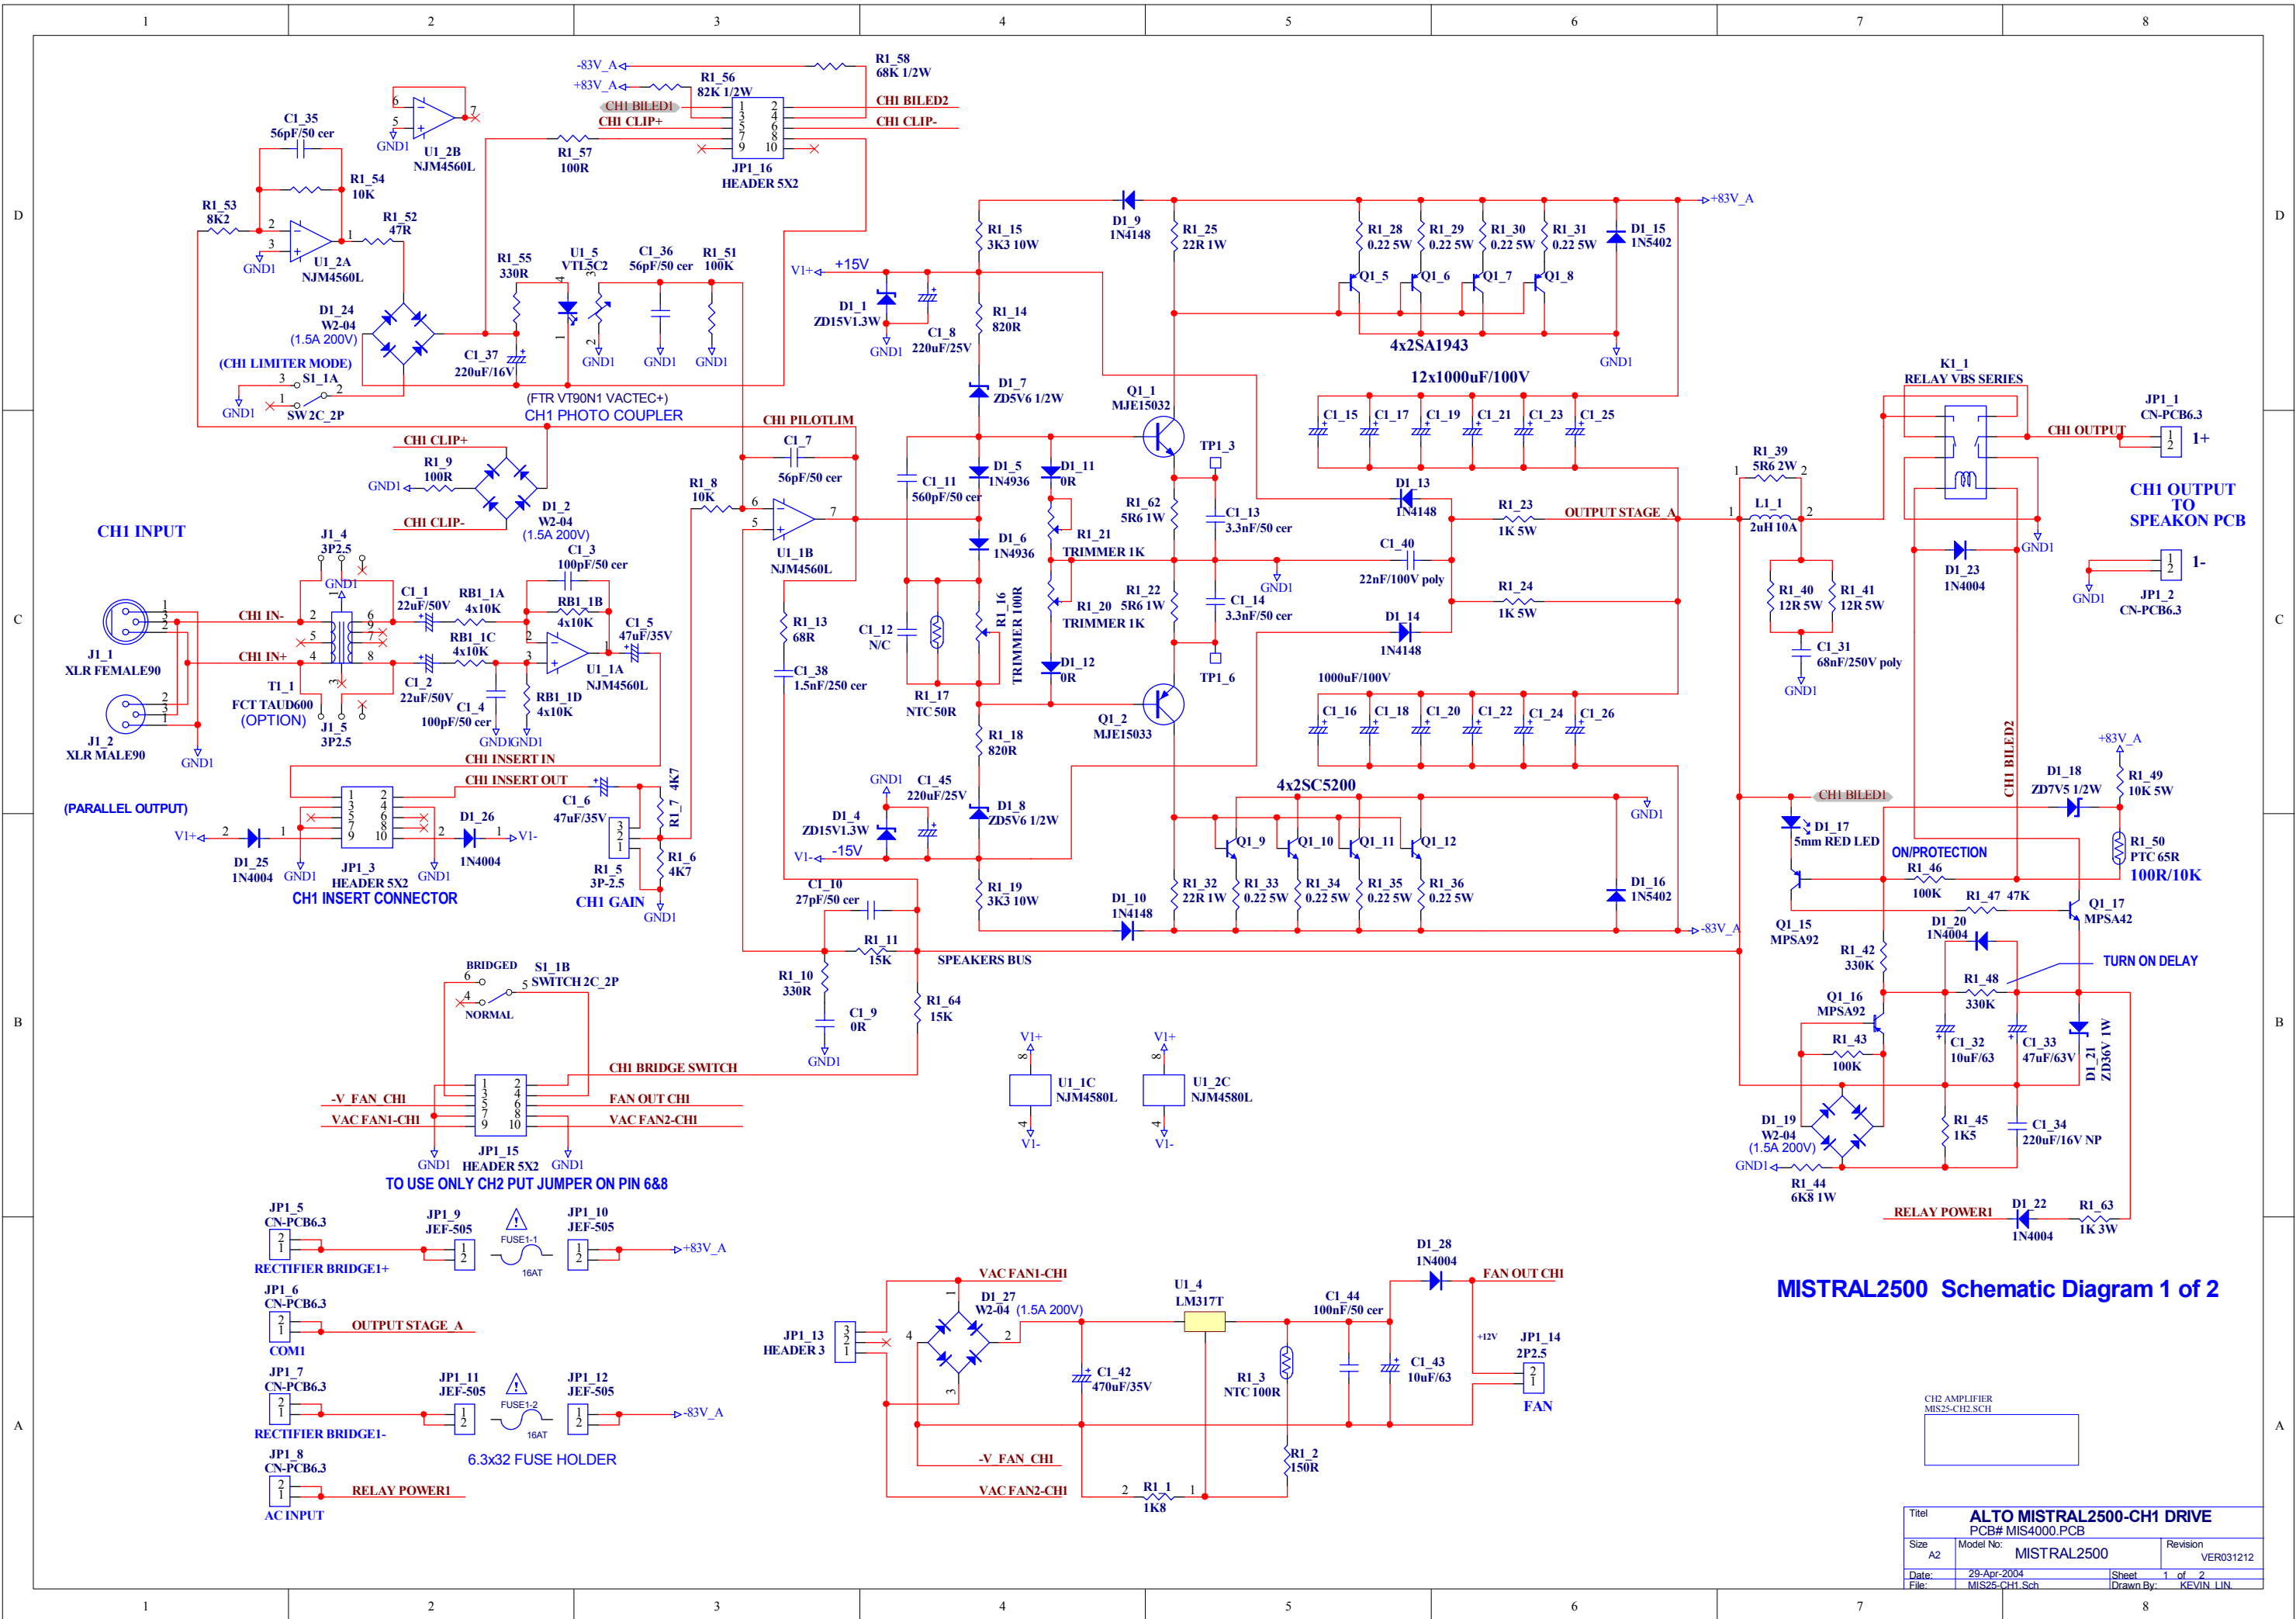

ALTO MISTRAL amplifiers are series of innovative design power amplifiers. This series work under high stability with great power supply in just 2-rack spaces. Airflow is from back to front panel to keep in a nice air circulation inside the Rack. The automatic fan, which affects the temperature of machine includes various kinds of speed, therefore, this low-noise fan makes a good result in cooling the heat from machines. MISTRAL amplifiers include 2 independent channels with separate protection system and power supply. The independent protection system avoids opening circuit, short, and wrong loading or over-heating. The special-designed protective system applies automatically restarting functions upon the default status and then goes back to normal. All electronic inputs equip standard power connectors. And all inputs are electronic balanced, with hi-quality transformer, MISTRAL amplifiers provide an outstanding performance in any conditions.

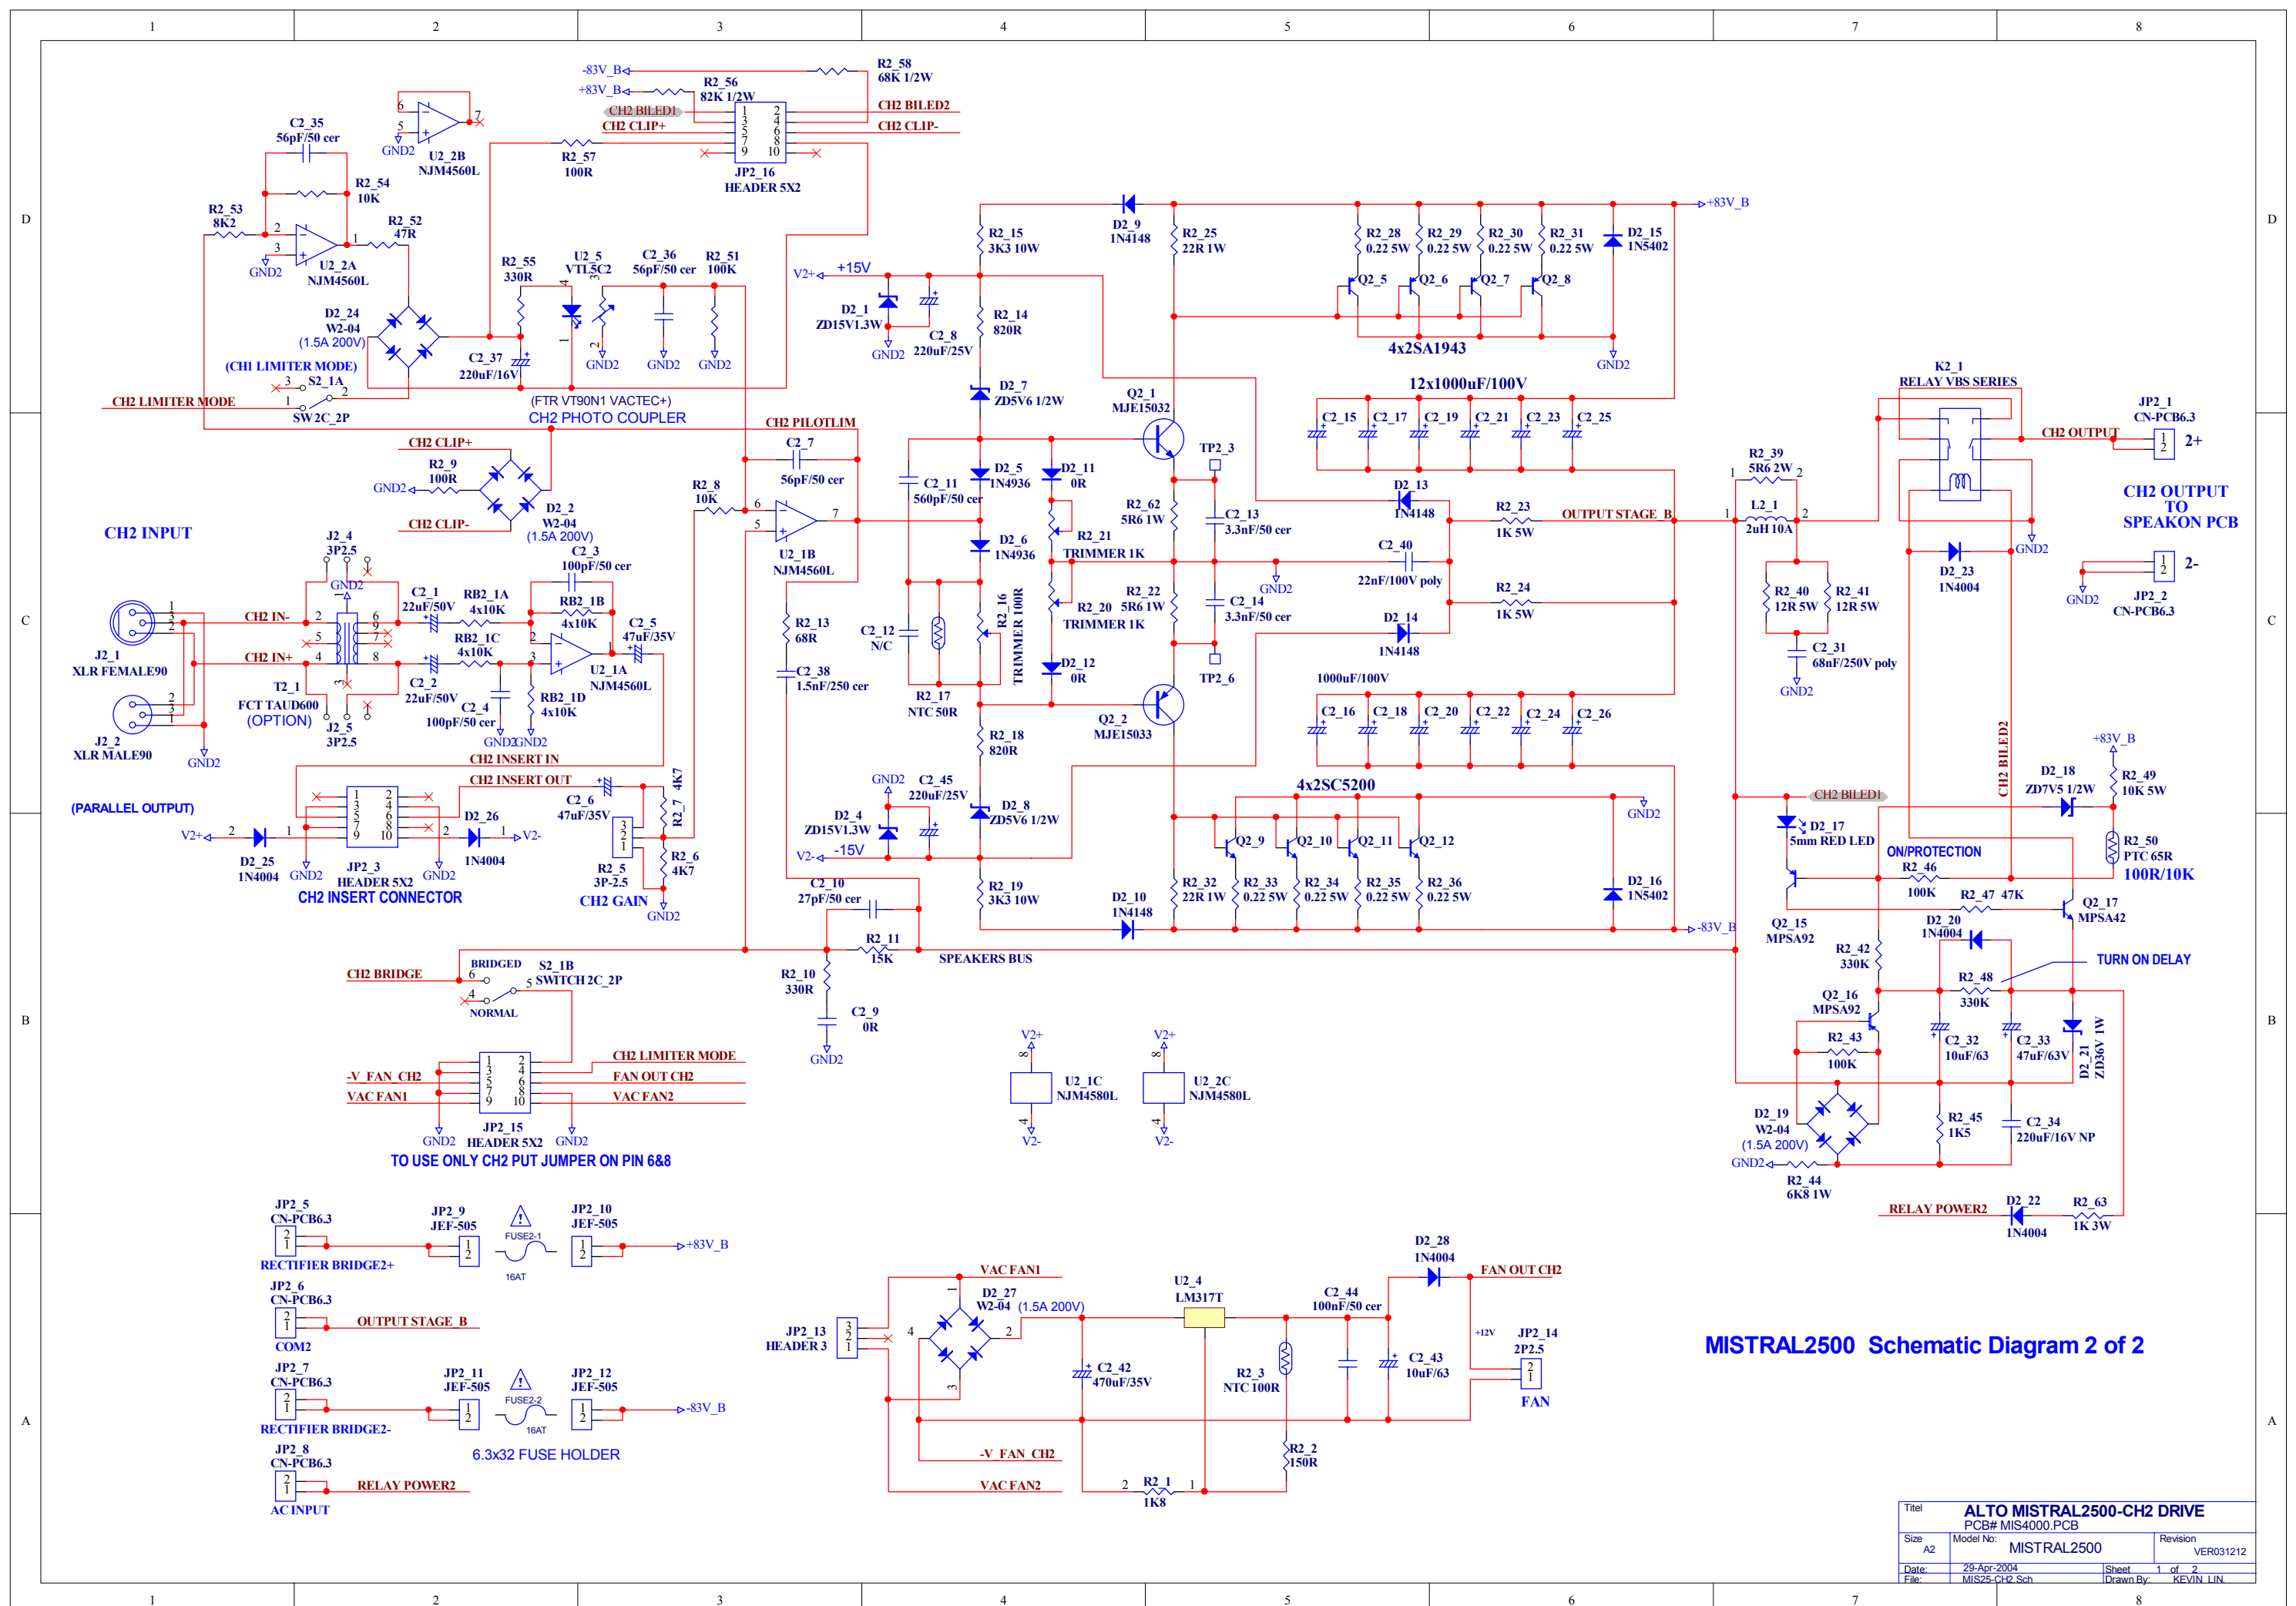

- . Innovative design and high stability power amplifiers.
- . Fan-cooled AB class high power amplifier in 19"rack, 2Usize
- . Rugged amplifiers in a strong, compact chassis.
- . 2 independent channels with separate protection system and power supply
- . Smart-designed protection system for auto re-operation after fault.
- . Auto-adjusting speed fan.
- . 4LEDs for operation/protection, limit, power on and clip
- . High-current toroidal transformer designed for high power at 20hms with low noise.
- . Independent DC and thermal overload protection on each channel.
- . IEC standard power connectors.
- . Binding post and NEUTRIK® SPEAKON outputs power connectors.
- . Balanced XLR inputs/ parallel outputs.

6. Test Procedure

1) Test Equipment:

1.Frequency transformer 2.Digital voltage meter 3.AP (Audio precision) 4.Oscilloscope

5.Two 8 (400W) load

2) Test procedures and specification

1.Set LIMITER and BRIDGE switches at OFF, turn VR of CH1 and CH2 to maximum, then turn on the power switch and the blue power LED lights up, and OPERATING/PROTECTION LED shows red then become green after 2-5 seconds or so.

2. Applied no signal, adjust R1-16(CH1) and R2-16(CH2) so that the voltage of R1-17/2-17 is $138\pm 2\text{mV}$. Connect a 4 load at output, input a 5KHz signal into CH1 or CH2, adjust the signal so that the output is 5VP-P (about 2VRMS), verify the curve on oscilloscope and there shall be no crossover distortion. Adjust the output signal level so that the distortion on oscilloscope is about 1.5-2%, adjust R1-20, R1-21(CH1) and R2-20, R2-21(CH2) so that the crossover distortion reaches its peak (note: the power supply shall be remained in 230V).

3. Input a 1KHz, - 4dB signal, the output shall be $48\text{V}\pm 0.5\text{V}$ and the distortion shall be less than 1%. Using the multifunctional meter to measure two pins of JP1_14(JP2_14), the voltage shall be increasing up (about 10V at first). Using a tweezers to short D1_18 (2_18), the overheat protection will start (no signal output).

4.To short the output terminal, the LIMITER on front panel is lit, the power consumption is less than 485W while in short protection.

5.S/N: larger than 90dB(A weighted is more than 102dB)

6. Compressor function test: LIMITER switch is set at ON, input a 1KHz / +12dB signal, the LIMITER LED is lit in yellow and there is no clipped signal.

7.Adjust the VR on front panel so that the output is 2V(4). The measured frequency response is more than 30Hz to 20 kHz $\pm 1\text{dB}$ (CH1/CH2).

8.Press the BRIDGE switch down, input a 1KHz signal into CH1(the level control of CH2 is turn to minimum), connect a 8 load to output terminal, measure the bridged output voltage is more than about 85V and the distortion is less than 1%. (This measurement shall be done in a minute).

9.Turn off the input signal, the power consumption shall be less than 85W.
